Bump'R Documentation

Release 0.3.5

Axel Haustant

January 10, 2017

Contents

Bump'R is a version bumper and releaser allowing in a single command:

- Clean-up release artifact
- Bump version and tag it
- Build a source distribution and upload on PyPI
- Update version for a new development cycle

Bump'R intend to be customizable with the following features:

- Optionnal test suite run before bump
- Customizable with a config file
- Overridable by command line
- Extensible with hooks

The main goal is to provide a release workflow without manual intervention.

CHAPTER 1

Compatibility

Bump'R requires Python 2.6+

CHAPTER 2

Installation

You can install Bump'R with pip:

```
$ pip install bumpr
```

or with easy_install:

```
$ easy_install bumpr
```

CHAPTER 3

Usage

You can use directly the command line to setup every parameter:

```
$ bumpr fake/__init__.py README.rst -M -ps dev
```

But Bump'R is designed to work with a configuration file (`bumpr.rc` by defaults). Some features are only availables with the configuration file like:

- commit message customization
- hooks configuration
- multiline test, clean and publish commands

Here's an exemple:

```
[bumpr]
file = fake/__init__.py
vcs = git
tests = tox
publish = python setup.py sdist register upload
clean =
    python setup.py clean
    rm -rf *egg-info build dist
files = README.rst

[bump]
unsuffix = true
message = Bump version {version}

[prepare]
suffix = dev
message = Prepare version {version} for next development cycle

[changelog]
file = CHANGELOG.rst
bump = {version} ({date:%Y-%m-%d})
prepare = In development

[readthedoc]
id = fake
```

This way you only have to specify which part you want to bump on the command line:

```
$ bumpr -M -s rc4  # Bump the major with an 'rc4' suffix
$ bumpr     # Bump the default part aka. patch
```

CHAPTER 4

Documentation

4.1 Workflow

When you execute Bump'R it will follow the following workflow:

1. clean
2. test
3. bump
4. publish
5. prepare

If you have been using Maven, it's inspired by the Maven Release Plugin.

4.1.1 Clean phase

Optionnal phase that simply execute the commands provided by the `clean` configuration parameter.

4.1.2 Test phase

Optionnal phase that simply execute the commands provided by the `tests` configuration parameter.

4.1.3 Bump phase

This is the main phase in which Bump'R will:

1. Compute replacements
2. Execute the bump phase for each hook
3. Bump replacement in version file and extra files
4. Commit the changes if a VCS is configured with `commit=True`
5. Tag the previously created commit if `tag=True`

4.1.4 Publish phase

Optionnal phase that simply execute the commands provided by the `publish` configuration parameter.

Most of the time for Python project, you will want to execute:

```
python setup.py sdist register upload
```

4.1.5 Prepare phase

This is the second main phase in which Bump'R will:

1. Compute replacements
2. Execute the prepare phase for each hook
3. Bump replacement in version file and extra files
4. Commit the changes if a VCS is configured with `commit=True`

4.2 Configuration file

The `bumpr.rc` configuration file is an inifile with the following possible sections and keys.

Note: You can also use the `setup.cfg` file to store the configuration. It's recommanded to prefix section with `bumpr:` (*ie.* `[bumpr:bump]`). Be carefull, when using Python 3, `setup.cfg` is parsed with ConfigParser and perform string interpolation.

4.2.1 bumpr

This is the main section defining the common behavior and parameters.

file *Default:* `None`

The file containing the version string to extract.

regex *Default:* `r'(__version__|VERSION)\s*=\s*(\'|")(?P<version>.+?)(\'|")'`

The regex used to extract the version string. It must have a `version` named group.

encoding *Default:* `utf8`

The files encoding.

vcs *Default:* `None`

commit *Default:* `True`

If `True` and vcs is defined, commit the changes.

push *Default:* `False`

If `True` and vcs is defined, push the changes and the tags to the upstream repository.

tag: *Default:* `True`

If `True` and vcs is defined, tag the version.

tag_format: *Default:* `{version}`

Specify the format of the tag

verbose *Default:* `False`

If `True`, display verbose output and command line output.

dryrun *Default:* `False`

If `True`, no command or VCS operation will be executed. They will be displayed in the command output.

clean *Default:* `None`

Specify the commands to be executed on the *clean* phase. Should have a single command by line.

tests *Default:* `None`

Specify the commands to be executed on the *test* phase. Should have a single command by line.

publish *Default:* `None`

Specify the commands to be executed on the *publish* phase. Should have a single command by line.

files *Default:* `[]`

Extra files to process. Those files will be processed by hooks to. Specify one file by line.

4.2.2 bump

This section define the bump phase behavior.

unsuffix *Default:* `True`

If `True` the current verion suffix will be removed.

suffix: *Default:* `None`

If set, this suffix will ba appended to the version.

part: *Default:* `None`

Specify the part to bump between `major`, `minor` or `patch`.

message *Default:* `Bump version {version}`

Specify the commit message that will be bumped. You can use the following token in your format pattern: `version`, `major`, `minor`, `patch` and `date`. All formating operations are accepted.

4.2.3 prepare

This section define the prepare phase behavior.

unsuffix *Default:* `False`

If `True` the current verion suffix will be removed.

suffix: *Default:* `None`

If set, this suffix will ba appended to the version.

part: *Default:* `patch`

Specify the part to bump between `major`, `minor` or `patch`.

message *Default:* `Update to version {version} for next development cycle`

Specify the commit message that will be bumped. You can use the following token in your format pattern: `version`, `major`, `minor`, `patch` and `date`. All formating operations are accepted.

4.2.4 hooks

Each hook can contribute to configuration with its own section.

See Hooks.

4.2.5 sample

Here a sample `bumpr.rc` file

```
[bumpr]
file = fake/__init__.py
vcs = git
tests = tox
publish = python setup.py register sdist upload
clean =
    python setup.py clean
    rm -rf *egg-info build dist
files = README.rst

[bump]
message = 'Commit version {version}'

[prepare]
suffix = dev
message = Prepare version {version} for next development cycle

[changelog]
file = CHANGELOG.rst
bump = {version} ({date:%Y-%m-%d})
prepare = In development

[readthedoc]
id = bumpr
```

4.3 Command line usage

The bumpr executable can be used in two way:

- one shot usage with all parameters on command line
- regular usage with most of the parameters in a configuration file

The default configuration file name is `bumpr.rc` but you can override it with the `-c` option.

All mandatory parameters not present in the configuration file should be on command line.

```
$ bumpr -h
usage: bumpr [-h] [--version] [-v] [-c CONFIG] [-d] [-st] [-b | -pr] [-M] [-m]
             [-p] [-s SUFFIX] [-u] [-pM] [-pm] [-pp] [-ps PREPARE_SUFFIX]
             [-pu] [--vcs {git,hg}] [-nc] [-P] [-nP]
```

```
              [file] [files [files ...]]

Version bumper and Python package releaser

positional arguments:
  file                  Versionned module file
  files                 Files to update

optional arguments:
  -h, --help            show this help message and exit
  --version             show program's version number and exit
  -v, --verbose         Verbose output
  -c CONFIG, --config CONFIG
                        Specify a configuration file
  -d, --dryrun          Do not write anything and display a diff
  -st, --skip-tests     Skip tests
  -b, --bump            Only perform the bump
  -pr, --prepare        Only perform the prepare

bump:
  -M, --major           Bump major version
  -m, --minor           Bump minor version
  -p, --patch           Bump patch version
  -s SUFFIX, --suffix SUFFIX
                        Set suffix
  -u, --unsuffix        Unset suffix

prepare:
  -pM, --prepare-major  Bump major version
  -pm, --prepare-minor  Bump minor version
  -pp, --prepare-patch  Bump patch version
  -ps PREPARE_SUFFIX, --prepare-suffix PREPARE_SUFFIX
                        Set suffix
  -pu, --prepare-unsuffix
                        Unset suffix

Version control system:
  --vcs {git,hg}        VCS implementation
  -nc, --nocommit       Do not commit
  -P, --push            Push changes to remote repository
  -nP, --no-push        Don't push changes to remote repository
```

4.4 Hooks

4.4.1 Read the doc

This hook allow to change the Read The Doc documentation URL in both bump and prepare phase.

- **key**: `readthedoc`
- **parameters**
  - id: `None`
  - url: `http://{id}.readthedocs.org/en/{tag}`
  - bump: `{version}`

  - prepare: `latest`

Most of the the time, you will just have to specify your readthedoc project identifier.

```
[readthedoc]
id = myproject
```

You can customize the generated (and parsed) URL and the string to bump in.

```
[readthedoc]
url = http://custom.doc/{tag}
```

You can also customize the tag part in the url for the bump and prepare phase

```
[readthedoc]
bump = {version}
prepare = lastest
```

4.4.2 Changelog

This hook allow to bump and prepare your changelog. In the bump phase it will bump the current developpement header with a versionned one. In the prepare phase, it will do the inverse operation.

- **key**: `changelog`
- **parameters**
  - file: `None`
  - separator: `-`
  - bump: `{version} ({date:%Y-%m-%d})'`
  - prepare: `Current`
  - empty: `Nothing yet`

The file parameter is mandatory and designate the changelog file.

The separator parameter spcify the character user to underline your changelog section.

```
Changelog
=========

In development
~~~~~~~~~~~~~~

- Another feature

Version 1.0.1 (2013-08-23)
~~~~~~~~~~~~~~~~~~~~~~~~~~

- Some new feature
```

To handle this changelog you will have the following configuration

```
[changelog]
file = CHANGELOG
separator = ~
bump = Version {version} ({date:%Y-%m-%d})
prepare = In development
empty = Empty
```

If you execute Bump'R, the changelog will be bumped like:

```
Changelog
=========

Version 1.0.2 (2013-08-24)
~~~~~~~~~~~~~~~~~~~~~~~~~~

- Another feature

Version 1.0.1 (2013-08-23)
~~~~~~~~~~~~~~~~~~~~~~~~~~

- Some new feature
```

And then prepared:

```
Changelog
=========

In development
~~~~~~~~~~~~~~

- Empty

Version 1.0.2 (2013-08-24)
~~~~~~~~~~~~~~~~~~~~~~~~~~

- Another feature

Version 1.0.1 (2013-08-23)
~~~~~~~~~~~~~~~~~~~~~~~~~~

- Some new feature
```

4.4.3 Commands

This hook allow to execute custom commands during bump and prepare phases.

- **key**: `commands`
- **parameters**
  - bump: `{version}`
  - prepare: `latest`

Both bump and prepare command can be mutiline (a command statement by line), and support the following format token:

- **version**: the current phase version string
- **major**: the current phase version major part
- **minor**: the current phase version minor part
- **patch**: the current phase version patch part
- **date**: the current date (aka. the release date)

In the bump phase, version will be the bumped version whereas in the prepare phase it will be the prepared/next version.

Exemple:

```
[commands]
bump = echo "{major}.{minor} - {date:%Y-%m-%d)"
prepare = echo "Next version: {version}"
```

4.5 Changelog

4.5.1 0.3.5 (2017-01-10)

- Allow to specify a custom tag pattern

4.5.2 0.3.4 (2017-01-10)

- Added *-st/–skip-tests* option

4.5.3 0.3.3 (2017-01-08)

- Push action is verbose

4.5.4 0.3.2 (2017-01-08)

- Fix some boolean handling from commandline

4.5.5 0.3.1 (2017-01-08)

- Ensure push is executed
- Fix boolean parsing
- Fix error handling on version extraction

4.5.6 0.3.0 (2017-01-08)

- Support seprator omission in changelog (for markdown)
- Add readthedoc badge support.
- **Breaking** Use https and readthedocs.io as default
- *setup.cfg* declaration support
- Optionnal *bumpr:* prefix support
- Switch to pytest

4.5.7 0.2.1 (2015-11-21)

- Use nosetests instead of custom discovery
- Some fixes on Python 3 (mostly encodings)
- Improve error handling
- Validate configuration

4.5.8 0.2.0 (2013-08-24)

- colored diff
- Added `--bump` and `--prepare` to only perform bump or prepare
- Rely on VCS for tracking files and ensure working copy is clean
- Added option `--nocommit`
- Ensure dry run does not write or execute anything
- Better output and error handling
- Group parameters in help
- Added optionnal hook vaidation
- Fix some Python incompatibilities (Python 2.6 and 3.X)
- More documentation

4.5.9 0.1.0 (2013-08-22)

- Initial release. Missing some parts but working!
